

CareerBuddies Founder Ledger

Super Master Implementation Report

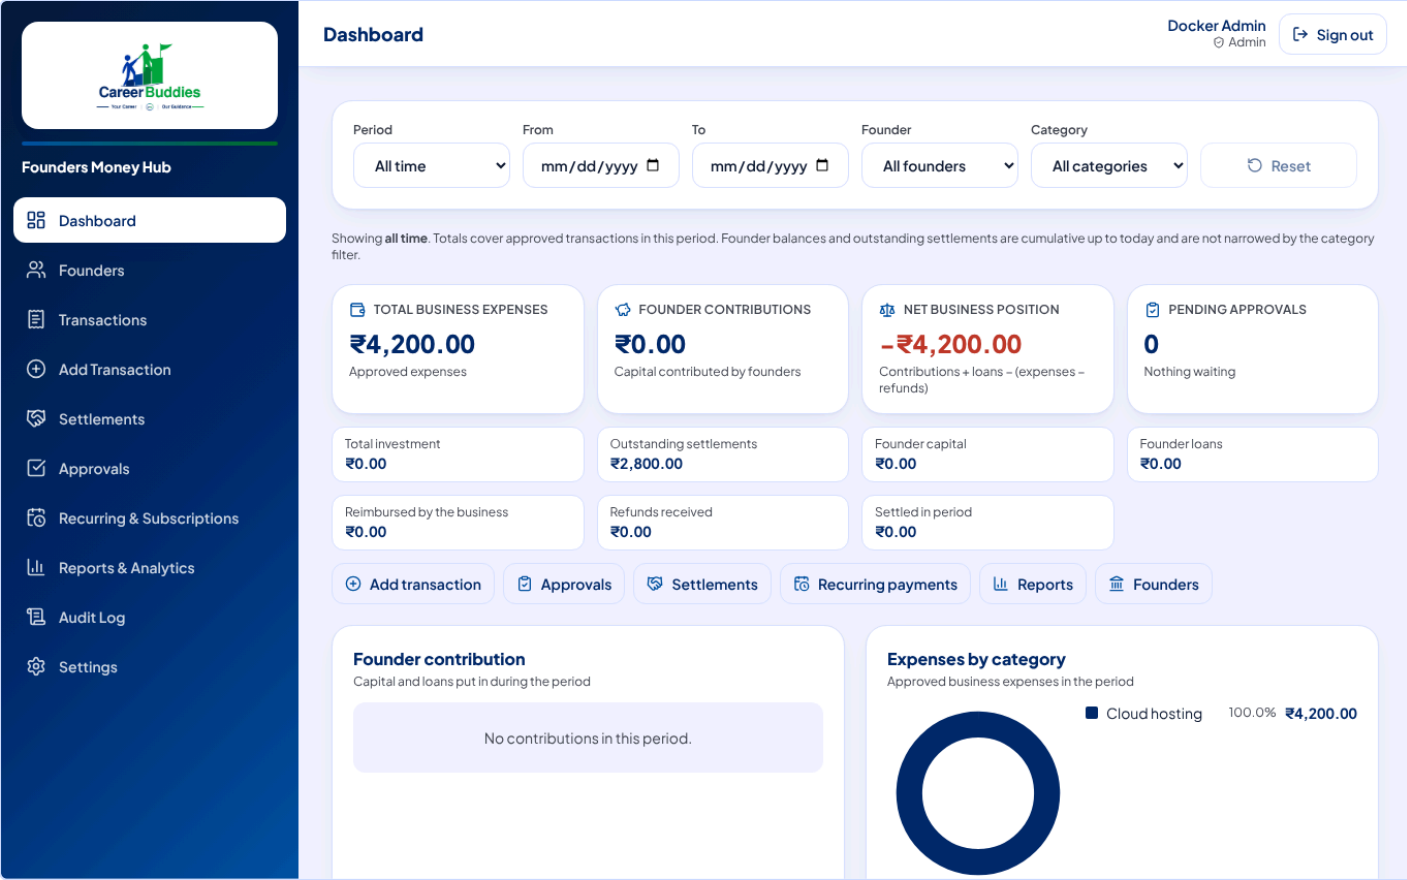

Branch `claude/compassionate-bardeen-9zxrjv` · Sandbox path `CB-Founder-Ledger/` · Generated 2026-10-09

1. Executive summary

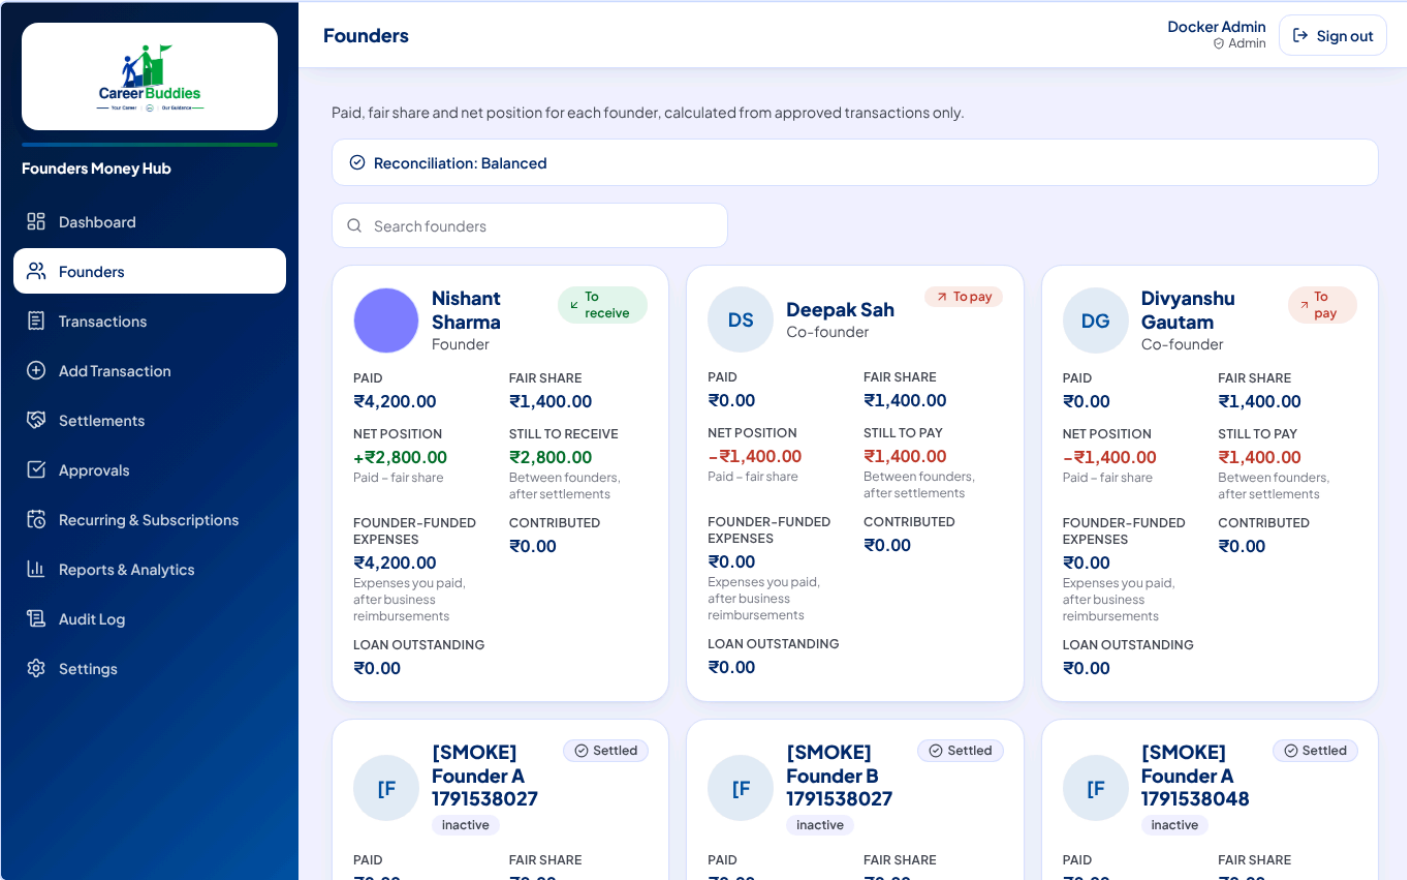

The complete Founder Ledger portal is implemented end to end (API, MongoDB, UI) inside `CB-Founder-Ledger/` : login, dashboard, founders, transactions, add/edit, settlements, approvals, recurring & subscriptions, reports with CSV export, audit log and a 12-section settings area that is persisted in MongoDB and applied without a restart. The approved Phase 3 Option C reimbursement policy and the existing security model are preserved. The existing database was upgraded in place (no reset, no wipe). Everything below marked **verified** was executed; items that could not be verified are listed in section 13.

2. Screens and functionality

Screen	Capability	Status
Login	Validation, show/hide password, brand from public endpoint, error states	Verified (browser)
Dashboard	4 required KPIs, extra figures, monthly trend, category breakdown, recent transactions, founder overview, upcoming recurring, settlement summary, shortcuts, filters	Verified
Founders / ledger	Cards + per-founder ledger, mandatory order, roles, photo placeholders	Verified
Transactions / Add / Edit	Filters, validation, duplicate-submit protection, optimistic concurrency, receipts, approve/reject/void	Verified
Settlements	Suggestions, record payment, approve, reverse (admin), history, net settlement	Verified
Approvals	Pending/approved/rejected tabs with counts, comment, rejection reason	Verified
Recurring	Add/edit/pause/resume/cancel/record; duplicate prevention; overdue / due soon	Verified
Reports	Filters, totals, annual (fiscal year), monthly, category, founder, CSV export (formula-injection safe)	Verified
Audit log	Admin only, filters, append-only, no secrets	Verified
Settings	12 sections, Save/Cancel/validation/unsaved-change prompt, MongoDB persistence	Verified

Dashboard (desktop, 1366×850) — data is from the throw-away test stack

Founders (mandatory order, neutral placeholders until photos are supplied)

3. Architecture and important file changes

Monorepo server/ (Node 22, Express 4, Mongoose 8, Zod 4), client/ (React 19, TypeScript strict, Vite, Tailwind 3), docker/ , docs/ , tests/ , assets/ . Money is stored as integer minor units. Central brand tokens: client/src/theme/brandTokens.js (from the website

palette: navy #002869, green #006e29, tints). One `app_settings` document is merged over code defaults and served by `GET /api/config`; the client `AppConfigProvider` is the single source.

Path	Change
server/src/domain/settings.ts, modules/settings/*	Settings schema, merge, GET/PATCH, branding/logo endpoints
server/src/modules/{approvals,recurring,reports,audit}/*	New feature APIs
server/src/modules/financials/settlements.record.ts	Record / confirm / reverse settlement payments
server/src/modules/transactions/*	approve/reject, idempotent create, audit hooks
server/src/db/migrations.ts, scripts/seedFounders.ts, importBrandAssets.ts	Idempotent, additive migrations and seeds
server/src/models/*	AppSettings, AuditEvent, RecurringPayment; Founder/Category/Transaction extended
client/src/features/*, lib/*, components/*	All screens, dirty-guard, dynamic brand/config
docker/docker-compose.yml, Dockerfile.server	branding-data volume, read-only assets bind mount
tests/browser/portal-browser.mjs, tests/smoke-docker.sh	Browser E2E (156 checks) and Docker smoke (102 checks)

4. Founder order and asset upload paths

Mandatory everywhere: **1. Nishant Sharma — Founder, 2. Deepak Sah — Co-founder, 3. Divyanshu Gautam — Co-founder.** Order, name and role are editable by admins in Settings → Founders; changes never alter historical accounting (keyed by founder id). The existing sandbox founders were renamed **in place** (same ids, no duplicates); a second run changed nothing.

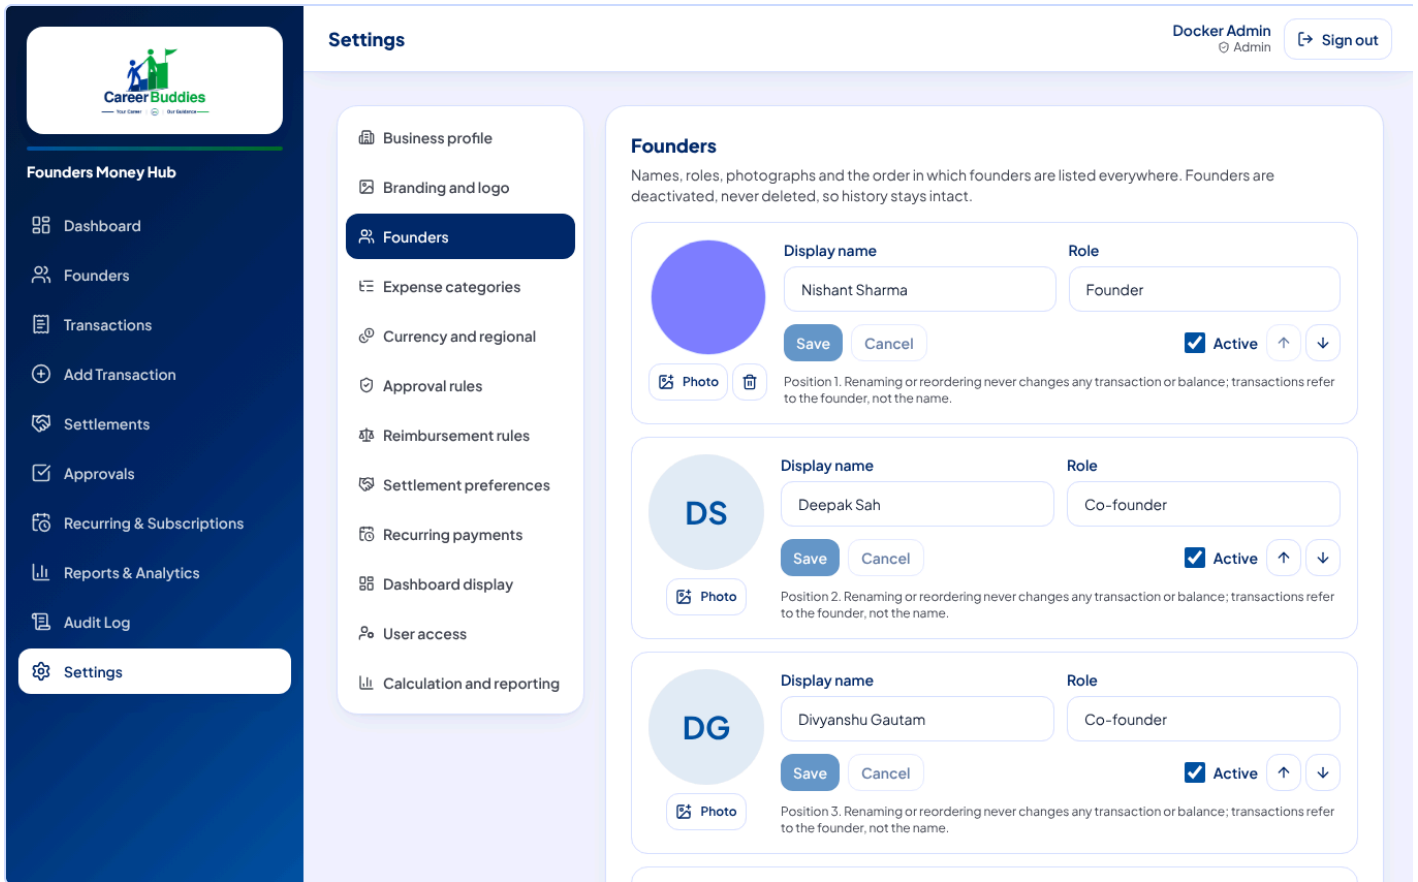

The owner supplies the logo and photographs — nothing was generated or substituted. Drop files at `assets/brand/careerbuddies-logo.(png|jpg|webp)` and `assets/founders/nishant-sharma.*`, `deepak-sah.*`, `divyanshu-gautam.*`, then run `importBrandAssets` — or upload in Settings. Type is checked by file signature (PNG/JPG/WebP), size limit 2 MB (configurable). Until then neutral initials placeholders and the default logo are shown.

5. Financial and reimbursement rules

Unchanged engine: integer minor units, largest-remainder allocation, only approved transactions count, $\text{Net} = \text{Paid} - \text{Fair share}$, $\Sigma \text{net} = 0$. Option C: reimbursements link to an approved expense; founder-funded = expense – active approved linked reimbursements; an expense with active reimbursements cannot be voided; voiding a reimbursement restores it; no capital pool or multi-payer. Verified in the browser: a ₹3,000 expense with a ₹1,000 reimbursement gives founders' nets +1,333.33 / –666.67 / –666.66. **Unresolved (isolated, documented in docs/PORTAL.md):** loan-repayment netting and refund linking are not defined by the Product Plan.

6. Settings persistence and propagation

Stored in MongoDB (`app_settings`), validated server-side with strict Zod schemas and optimistic versioning, audited as `SETTINGS_CHANGED`. Acceptance test (browser, verified): changing the business name updates the sidebar and browser tab immediately, persists after a full reload, is shown on Dashboard, Founders, Transactions, Reports and the signed-out login page; invalid input is blocked; Cancel restores; navigating away with unsaved changes prompts first. Currency/locale and category changes propagate to forms and filters. Reimbursement and calculation policy is shown read-only on purpose.

Settings → Founders

7. Security and database changes

HttpOnly cookie sessions; role checks on every mutation (a 33-case authorization matrix test); Zod validation of bodies and queries; rate limiting; append-only audit log and revisions (hard deletes blocked); secrets redacted from audit data; CSV formula-injection guard; idempotency key on create; unique recurring key. Database changes are additive and idempotent (`runMigrations` backfills founder order; new collections `app_settings`, `audit_events`, `recurring_payments`). No drop, reset or wipe was performed on the main database; data persisted across restart and down/up without `-v`. Only the throw-away `cbfresh` test project was recreated with `-v`.

Audit log (admin only)

8. Build and test results (actually executed)

Check	Result
Server typecheck + build	clean
Client typecheck (tsc -b) + Vite build	clean
Server tests (Vitest + supertest, real MongoDB 7)	403 passed / 403 in 26 files
Client tests (Vitest + Testing Library)	92 passed / 92 in 7 files
Docker smoke (main stack :8080)	102 passed / 0 failed
Browser E2E (Playwright + Chromium, fresh stack :8090)	156 passed / 0 failed
Docker Compose build, start, health, DB connected	verified; migration log confirmed
Persistence across restart and down/up (no -v); idempotent seeds	verified

Required test areas covered: expense create/edit; approve/reject/void; partial/full/multiple reimbursements; reimbursement void restore; invalid/excess reimbursements; expense-void restriction; settlement suggestions and confirmation; recurring duplicate prevention; rounding/boundaries; dashboard/report/founder reconciliation; unauthorized financial mutations.

9. Browser and responsive verification

The browser run (156 checks) covers login/validation/sign-out, every screen, founder order and photo upload/reorder, settings propagation, transaction create with triple-click duplicate protection, approvals, the Option C reimbursement flow and void guard, settlements record/approve/reverse, recurring, reports/CSV reconciliation with the dashboard, audit log, founder-role restrictions and the `/ledger` and `/#ledger` entry. Responsive checks at four viewports on 13 screens found one real defect (Settings overflowed horizontally on tablet/mobile); it was fixed and re-verified (no horizontal overflow).

10. Local testing URL

The stack runs **in the sandbox**: `http://localhost:8080` there. That is not the user's Windows PC. To run on the PC follow `docs/WINDOWS-LOCAL-SETUP.md` (`docker compose --env-file .env -f docker/docker-compose.yml up --build -d` , then open `http://localhost:8080`). PC commands could not be executed from the sandbox and are unverified there. Credentials are intentionally not printed here.

11. Future website integration

Not integrated and not deployed; the public `careerbuddies.in/#ledger` URL does **not** work yet and is not claimed to. A fragment cannot mount an app; the portal provides the entry route `/ledger` (and `/#ledger`) and an independently deployable stack. Checklist in `docs/WEBSITE-INTEGRATION.md` : deploy privately over HTTPS; add a reviewed redirect/link in the website repo; verify cookies, CORS and no unauthenticated data; then announce.

12. Git

Branch `claude/compassionate-bardeen-9zxrjv` . Code commit `95d22b4` (browser suite, smoke extension, layout fix, docs) on top of earlier feature commits; this PDF is committed afterwards (final hash reported in chat). No `.env` , uploads or secrets are in the diff.

13. Known limitations and unresolved requirements

- UI reference image “CareerBuddies Founder Ledger UI Showcase(1).png” was **not available**; design follows the written brief and website tokens, so pixel parity was not checked.
- Logo and founder photos not yet supplied — placeholders shown.
- Not verified on the user's Windows PC; no public deployment.
- Loan-repayment netting, refund linking, two-founder approval, “Ask a question” and PDF export of reports are not built (rules undefined).
- Policy (reimbursement/calculation) is read-only; changing it needs an audited migration, not built.
- Mobile dashboard shows the full filter block above the KPIs (usable, could be collapsed).
- Browser suite leaves the business display name changed on the throw-away stack; it is not run against the main data.
